
iFrame

Is it possible to enable the demo as an iFrame. You see, I want to be able to show the demo to a potential customer, and don't want your website to pop up.

The easiest way to accomplish this is to use index2.php in place of index.php on the pages you need. Example:

Reservation Wizard:

http://demo.tableboss.com/index2.php?option=com_tableboss&Itemid=45

Reservation Desk:

http://demo.tableboss.com/index2.php?option=com_login&Itemid=48

You can use these urls in an iframe to display only the component. The reservation desk will only work the first time, as it is being redirected from the login screen. Subsequent page refreshes will bring up a screen to log out.

Regards-
Mark
