
Can TableBoss be used as a directory solution?

Posted by Richard - 2007/09/22 16:39

I run a local directory and i want to offer local restaurants the option to take bookings from our directory. So my question is can this be used for more than on site? Could a user book a table from my website for more than one restaurant?

TableBoss is not a multi-restaurant solution. The component is intended as a restaurant to consumer tool. It only supports one restaurant in the configuration.

We plan on expanding the component to allow for multiple rooms per restaurant, and then multiple locations.

Regards-
Mark

well this is the solution I am looking for and many others too I can guess. Make this work with directories like Mosets Tree 2.0.3, Hot Property, SOBI2 etc where you can have listings like restaurants that also could include this kind of booking facilities for different restaurants....

hope you can focus to have this and bring this in soon..:P
